Allowable Subject Matter

Claims 1-18 allowed.

Soberski in US Patent 3,741,232, Figures 6-9 shows a poppet biased by a spring 64 that meets deformable seal 39 that has two deformed positions shown in Figs. 7-.8 (one position) and Fig. 9 (another position). However the three positions do not correspond to a first negative pressure level when the seal is in a first deformed configuration, permitting a first fluid flow from one side to the other when the seal is in a second deformed configuration, and permitting a second fluid flow in the opposite direction when the seal is in an undeformed configuration as in the instant invention.

While Soberski also does not teach a sensor detecting the first arrangement of the pressure operable device during the leak detection test Perry et al. in US Patent 6,328,021 does. The sensor advantageously allows a processor to use the valve position to monitor pressure relief events in a leak diagnostic procedure.

However, the prior art also does not disclose leak detection based calculating an in-use rate value by dividing a number of monitoring events by a number of driving events of the vehicle, the number of monitoring events being based on the sensor detecting the first arrangement; and comparing the in-use rate value to a standard value as in the instant invention.
